# Boost Warehouse Efficiency with Indigo WMS

Holding excess inventory can be costly and is becoming more widespread due to future economic uncertainty. When it comes to raw materials and finished goods management, it's no longer a case of 'just in time' but a question of 'just in case'. Here are 5 ways Indigo WMS will boost your warehouse operations.

**Putaway management and location assignments** - Effective put-away maximises space utilisation and ensures product movements are minimised. Indigo WMS automates this by identifying where to store items based on available spaces, pick frequency and special storage considerations.

**Pick route optimisation and planning** - Travelling absorbs a large part of picking time, so sequencing tasks within an order is

crucial for efficiency. Indigo WMS evaluates the day's order pool, assigns tasks to operatives and shows them the fastest routes to reach stock items. Goods are picked more quickly, using minimal resources.

**Shelf life management and stock rotation** - Using Indigo WMS to optimise stock rotation means items with a limited shelf life are picked first to avoid wastage. Indigo WMS simplifies this by reminding operatives of which lots to select first.

**Perpetual inventory (PI) stock counting** - Daily PI or cyclical counting supported by Indigo WMS eliminates the need for monthly or annual stock counts. It is business as

usual whilst stock counting is in progress and shrinkage is minimised, because material movements are automatically tracked electronically.

**Traceability management**

- Indigo WMS creates reports detailing lot/batch/expiry date information which conform to compliance requirements and

enable trend analysis. Users have a full audit trail tracking each element of stock during its entire lifecycle, right down to the source of raw ingredients at the SKU, UPC and lot level.

Visit Indigo's stand at IntraLogistEX where our supply chain experts will be available with practical strategies to make your warehouse as efficient as possible.
